

Dear all friends and competitors

Thailand has sent two proposals already (one for mandatory limiters and voltage raise to 43V, another one for cancel hat system, cancel team races and, a proposal together with China, invent Mini FSRE). In addition, if it is not too late, there is one point in the FSRE rules which in our opinion needs to be erased. This point is, that FSR-E boats unlike any other boat class needs to be self righting. First off all, the driver of the boat should decide by himself if he wants to take the risk but it is also a restriction in the boat design possibilities. Plus, what if the flood chamber is installed but not working proper. If we follow the rules correctly each boat has to show the self righting abilities before starting the heat. Again, that leads to delays in heat starts and maybe in unnecessary DSQs.

Please discuss this point with racers in your countries.

Best regards to you

Ralf Thiele
